General Bending Problem for a Bar Composed of Different  
Materials (Obshchaya zadacha izgiba sterzhnya, sostavlennoye  
iz razlichnykh materialov)

PERIODICAL:

Izvestiya Akademii nauk Armyanskoy SSR. Seriya fiziko-mate-  
maticheskikh nauk, 1958,

Vol 11, Nr 5, pp 121 - 127 (USSR)

ABSTRACT:

The author considers a unilaterally fixed bar which is loaded by a single load at its end. The cross section is arbitrary but constant, and the bar consists of several parallel bars so that the cross section is composed of a number of sub-domains. The direction of the load is arbitrary. By means of the linear theory the author sets up equations and boundary conditions which the stress function has to satisfy. He does not discuss the question whether the considered boundary value problem is always solvable.

TITLE:

Approximate Solution of Some Problems of Torsion of Rods With a Thin Reinforcing Coat

PERIODICAL:

Izvestiya Akademii nauk SSSR. Otdeleniye tekhnicheskikh nauk. Mekhanika i mashinostroyeniye, 1959, Nr 4, pp 85-92 (USSR)

ABSTRACT:

The function  $F(x,y)$  of the stresses at the torsion of a prismatic rod with a thin reinforcing coat must satisfy the equation (0.1) of Poisson in each of the ranges  $D$  and  $D_1$  (Fig 1) of the cross section  $D_0$ , which correspond to the basic material of the rod and the material of the coat, the outline condition (0.2) and the conditions (0.3). As the thickness of the coat is very small as compared with the transverse dimensions of the rod, it is assumed that function  $F(x,y)$  in the  $D_1$ -range changes linearly in the direction  $n$ . The outline condition (0.4) for determining  $F$  is obtained from (0.2) and (0.3). The thickness of the coat  $\delta$  in (0.4) must be constant in the direction of the generating line of the cylindrical rod surface, but it may be variable along the outline of the cross section. The formulas

Card 1/3

SOV/179-59-4-11/40  
Approximate Solution of Some Problems of Torsion of Rods With a Thin Reinforcing Coat

(0.5) for the tangential stress in the  $D_0$ -range, and the formula (0.6) for the  $D_1$ -range, are written down. Formula (0.7) is given for the torsional resistance. By use of (0.5), and the formula by Grin and Ostrogradskiy, and after some transformations, the formula (0.8) for the torsional resistance in the  $D_0$ -range is obtained from (0.4). It is pointed out that for the solution of concrete problems a new function  $\tilde{\varphi}(x,y)$  is often introduced instead of  $F(x,y)$  by means of the formula (0.9). The new function satisfies Laplace equation.- The following cases are studied now: 1) Elliptic cross section. The problem of torsion of a rod with elliptic cross section and thin reinforcing coat is solved in elliptic coordinates. Formula (1.15) for  $F$ , formula (1.16) for the torsional resistance  $C$ , formulas (1.17) for tangential stresses, and formula (1.18) for the maximum tangential stress which occurs at the end of the semiminor axis of the elliptic cross section of the rod, are derived. When the thickness  $\mu$  of the coat in this case is set equal to zero, the known formulas for the torsional resistance and the maximum tangential stress at the torsion of a rod with elliptic cross section and without reinforcing coat are obtained from (1.16) and (1.18). 2) The

Card 2/3

SOV/179-59-4-11/40  
Approximate Solution of Some Problems of Torsion of Rods With a Thin Reinforcing Coat

torsion of a hollow rod, the cross section of which is limited by two confocal ellipses, and which has a thin reinforcing coat on the outer and inner surface, is investigated. 3) A round cross section with a round eccentric cavity (Fig 4). In the two latter cases 2) and 3), the same values, and formulas required for their computation, are determined as in case 1).- In conclusion, it is said that in the presence of a reinforcing thin coat the torsional resistance greatly increases while the tangential stresses change only slightly at the same torsional angle. There are 4 figures, 1 table, and 8 Soviet references.

TITLE: Torsion of a Hollow Rectangular Bar<sup>16</sup> With a Thin Strengthening Cover

PERIODICAL: Izvestiya Akademii nauk Armyanskoy SSR. Seriya fiziko-matematicheskikh nauk, 1959, Vol. 12, No. 6, pp. 89-102

TEXT: The authors consider the torsion of a prismatic bar, the rectangular cross section of which possesses a symmetric rectangular sector, where the external and internal surfaces of the bar are covered with a strengthening layer of constant thickness. The problem is based on (Ref. 1, 2) and reduced to the solution of two completely regular infinite systems of linear equations. The solution is carried out in two special cases with specification of the error.

(Remark of the reviewer: Details cannot be given, since the figure 1 to which the authors refer, and which contains the geometry of the cross section and the applied coordinate system, is missed in the text). There are 2 tables and 7 Soviet references.

AUTHORS: Galfayan, P. O. and Chobanyan, K. S. (Yerevan)

TITLE: The Problem of the Torsion of a Rectangular Bar with a Thin Reinforcing Covering

PERIODICAL: Izvestiya Akademii nauk SSSR, Otdeleniye tekhnicheskikh nauk, Mekhanika i mashinostroyeniye, 1960, Nr 1, pp 165-167 (USSR)

ABSTRACT: The paper is a continuation of previous work (Refs 1 and 3). The cross-sectional dimensions and the coordinate axes are defined in the figure (p 165). The torsional stress function satisfies Poisson's equation (1) and the contour condition (2), where  $\delta$  is the thickness of the covering and  $G, G_1$  are the shear moduli of the main material and covering, and  $C_0$  is a constant which may be taken as zero for a singly connected region. The torsional rigidity  $C$  and the shear stress  $\tau_{xz}, \tau_{yz}$  are determined by the formulae (3). The solution of Eq (1) is written in the form (12), where the  $\lambda_k$  are the successive roots of Eq (7); as  $k \rightarrow \infty, \lambda_k \rightarrow \pi(k-1)/a$ . The right hand side of (1) Card 1/3 is represented as the series (13), and  $F(x,y)$  is then given

The Problem of the Torsion of a Rectangular Bar with a Thin Reinforcing Covering

by (15) with A and B given by (17). Inserting these values in (15) and rearranging, the final expression for  $F(x,y)$  is (18). The torsion rigidity and shear stresses are then obtained as (19), with  $\vartheta$  the angle of twist. A numerical example is considered for a beam of square cross-section with a steel reinforcement of the thickness  $\delta = 0.1a$ ;  $G = 8 \cdot 10^4 \text{ kg/cm}^2$ ,  $G_1 = 8 \cdot 10^5 \text{ kg/cm}^2$ . The roots of (7) are  $a\lambda_1 = 1.312$ ,  $a\lambda_2 = 3.670$ ,  $a\lambda_3 = 6.573$ ,  $a\lambda_4 = 9.627$ ,  $a\lambda_5 = 12.72$ . The torsional rigidity  $C = 1.157 G a^4$  and the maximum shear stresses are  $\tau_{\max} = 0.532 G \vartheta a$  in the concrete and  $\tau_{\max} = 5.319 G \vartheta a$  in the iron. Thus the reinforcing covering increases the rigidity of the rod by more than eight times and the maximum shear stress in the main material for a given twist by 20%. Calculation shows that the first term of (19), corresponding to the root  $\lambda_1$ , gives a satisfactory approximation.

TITLE: Inactivated vaccine against Aujeszky's disease, prepared from virus grown in tissue culture

SOURCE: Veterinariya, no. 7, 1965, 19-20

TOPIC TAGS: virus disease, animal disease, vaccine, rabbit, virus, mouse, commercial animal

ABSTRACT: To confirm the possibility of inactivating the Aujeszky's disease virus, a dried strain of the virus was diluted 1:10 in a saline solution and then used to infect a rabbit, which died 72 hours afterward. The brain tissue of the dead rabbit was emulsified in a 1:10 saline solution, centrifuged for 30 minutes at 5,000 rpm, and the supernatant fluid was used to infect renal tissue culture of young rabbits. The virus grown in this way was found to be suitable for the production of inactivated aluminum-hydroxide formaldehyde-killed vaccine. Experiments on white mice showed that the vaccine containing 0.1% formaldehyde is more immunogenic than the vaccine containing 0.15% formaldehyde. Hence, subsequent experiments with sheep were based on the vaccine containing 0.1% formaldehyde. The vaccine proved to be immunogenic and produced persistent immunity to Aujeszky's disease in the vaccinated

sheep. The four vaccinated sheep survived, and displayed no symptoms of Aujeszky's disease, whereas control sheep died of this disease. This inactivated vaccine of the cultured Aujeszky's disease virus retains its activity for at least 3 months (the observation period) at a temperature of +2-6°C. Testing of this vaccine on a broader scale -- on different species of animals -- is thus indicated. Orig. art. has: 1 table. [JPRS]

2662. A CASE OF DIFFUSE SCLEROSIS OF THE BRAIN OF SCHILDER'S TYPE IN A 5-YEAR-OLD GIRL, DIAGNOSED DURING LIFE - Przypadek rozlanego stwardnienia mózgu typu Schildera u 5-letniej dziewczynki rozpoznany za życia - Chobotowa H. and Majewski C. Klin. Chorób Dzieci, Poznań - PEDIAT. POL. 1958, 33/10 (1234-1239) illus. 4

The authors accepted Neubürger's classification in which diseases with the characteristic morbid-anatomical picture of disseminated and diffuse sclerosis of brain are divided into 3 groups: inflammatory type (Schilder), neoplastic (Ceni) and heredo-degenerative (Spielmeyer). Subcortical encephalitis sclerosans cannot be taken into consideration because of its different morbid-anatomical picture.

for the purpose of establishing the most economically feasible final water content in the dried material are presented. Experiments ~~were~~ conducted on an installation, in which the drying agent (air) passed through water (0.1-0.2 m/sec velocity). Different operating conditions involved (temperature and relative humidity) were attained through variations of water temperatures. In the majority of experiments, relative humidity and temperature of air varied from 70-95 percent and 20-23°, respectively. The
